

Which industries have the highest sales?

Here are two clustered column chart to compare the values of total sales average, and yearly average sales for all the industries for the four years.

The charts illustrate that the telecommunication industry has the highest average sales throughout the four years, whereas the real estate industry has the lowest average sales during the four years.

The total average sales in all the industries is \$23.7 billion. Whereas, the median is \$18 billion. Thus, the data of the total revenues is shifted to the right, as the Mean is greater than the Median. By analyzing the data using the statistical tools, we found that there's a high variability and great dispersion as we had a large range and standard deviation. The data is scattered away from the average to the right and to the left.
